Survey & Analysis Methods

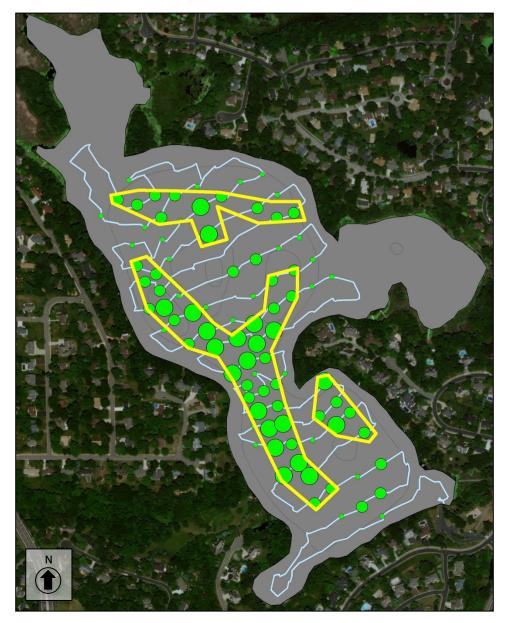

Spring Delineation Survey

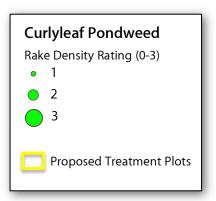

Freshwater Scientific Services, LLC completed delineation survey for CLP in Red Rock Lake (#27-0076) on May 8, 2018. During this survey, we navigated a meandering search path over the littoral portion of the lake (excluding shallow bays) while using a combination of surface observations, sonar readings, and rake tosses to locate and delineate areas of CLP growth. When we encountered CLP, we marked the location, recorded the water depth, and rated the density of the growth using visual and rake density scores as described in the table below.

Score	Visual	Rake
1	Light / Solitary plants	1-2 stems
2	Moderate / Scattered dense patches	3 to 9 stems
3	Dense / Uniform dense growth	10+ stems

For rake samples, we dragged a sampling rake over approximately 10 square feet of lake bottom and recorded the CLP density based upon the number of plants retrieved on the rake (stem count). The recorded water depths and density scores were linked to the appropriate GPS locations and then mapped using desktop GIS software.
